

# K7AGE

# PSK-31

*A Digital HF Mode*

*By N4UFP Marc Tarplee*

*Tweaks by K7AGE*

# First, a little bit about me

I was first licensed in 1968

I've been around video since high school

- **Built a TV camera as high school electronics project**
- **Worked on remote TV broadcast as cameraman and engineer**
- **Worked at college TV studio, Rochester Institute of Technology**

Work for broadcast equipment manufacturers

- **Grass Valley/Belden/Miranda/NVISION and Grass Valley Group**

First Youtube video in August 2006, now over 7 years

**100+ videos**

**Over 2,700,00 total views**

**Over 13000+ subscribers**

# What is PSK-31?

PSK-31 is a digital mode developed by

Peter Martinez, G3PLX

- *Introduced in 1998, 15 years ago*

PSK's advantages include:

- **Less bandwidth, more stations**
- **Better error rate than RTTY on noisy channels**
- **Lower RF power requirement, great for QRP ops**

PSK-31 uses

- **phase shift keying , not frequency shift like RTTY**
- **special code , Varicode**
- **Sound Card interface**

# Phase Shift Keying

PSK-31 uses Binary Phase Shift Keying (BPSK)

The keying rate is 31.25 bits/sec

The effective speed for plain English text is approximately 50 words/minute

# Phase Shift Keying

# Phase Shift Keying

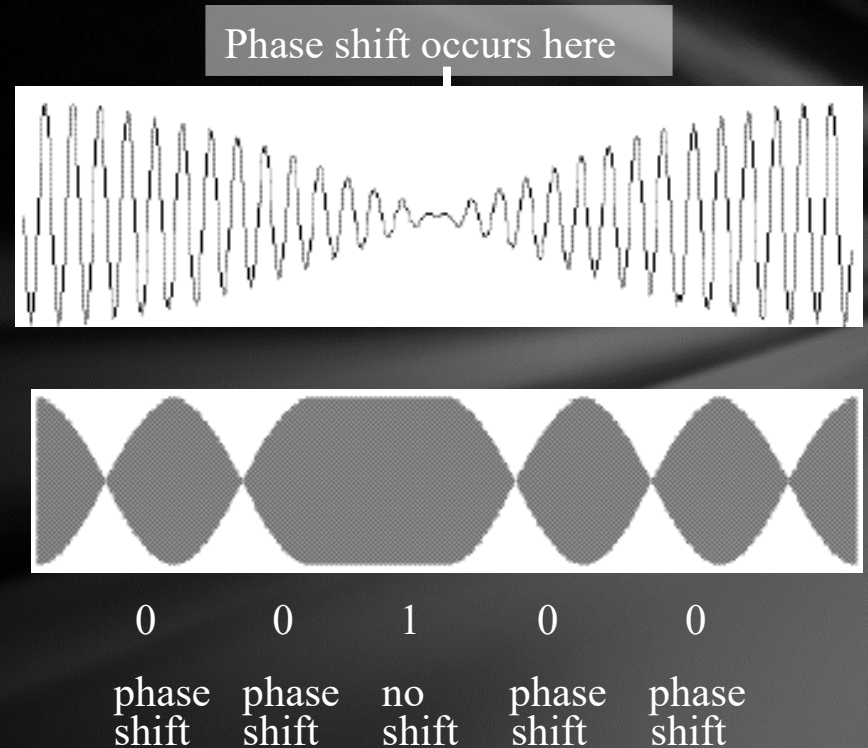

Why 31.25 bits/sec?

- This frequency is easily derived from the sound card's 8000 Hz clock frequency

To reduce the bandwidth of the PSK signal, the signal is shaped so that phase transitions occur only when the signal amplitude is zero

A "0" (space) is a 180 degree phase shift

A "1" (mark) is no phase shift

# Varicode

Developed by Peter Martinez G3PLX

The most frequently used characters use the least number of bits

- **e is much shorter than Z**
- **Lower case uses fewer bits than uppercase**

Unlike the Baudot code used for RTTY,

Varicode supports

- **127 character ASCII character set,**
- **which includes upper and lower case letters, @**
- **numbers and punctuation.**
- **And BACKSPACE!**

# Printable characters

**K7AGE HD**

# Real-World Performance of PSK-31

The chart at the left shows the character error rate as a function of signal-to-noise ratio.

**For S/N ratios greater than 10 dB, PSK-31 is virtually error free.**

At poor S/N ratios the error rate of PSK-31 is ~ 5 times better than RTTY

# Real-World Performance of PSK-31

The power in a PSK-31 signal is concentrated

- in a 31 Hz bandwidth,
- versus 250 Hz for RTTY

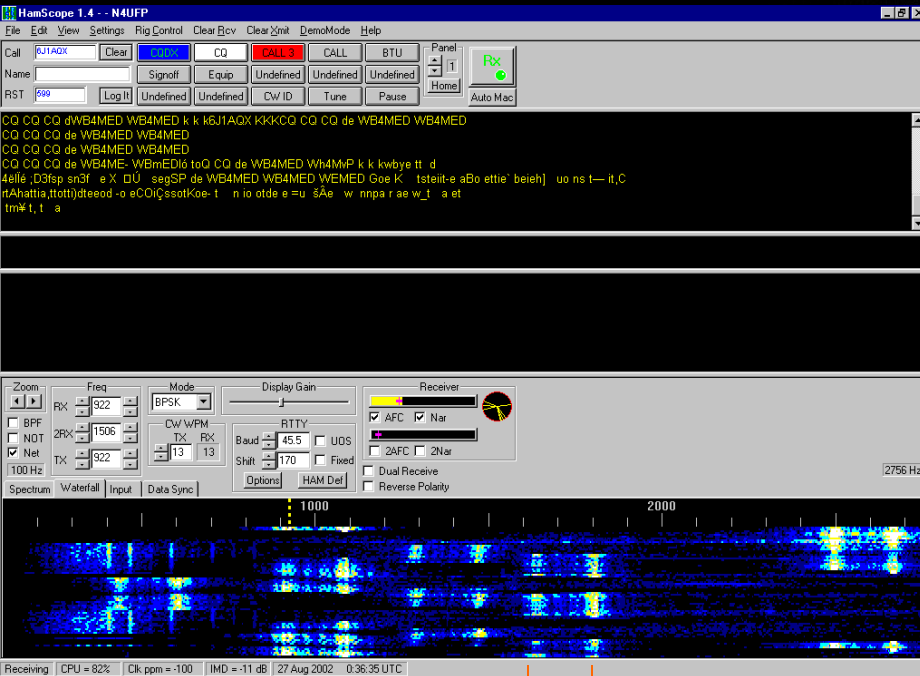

If a 100 W signal provides a 20 dB S/N ratio at the receiver using SSB,

- the same S/N ratio is achieved with 8W using RTTY
- and only 1W using PSK-31!

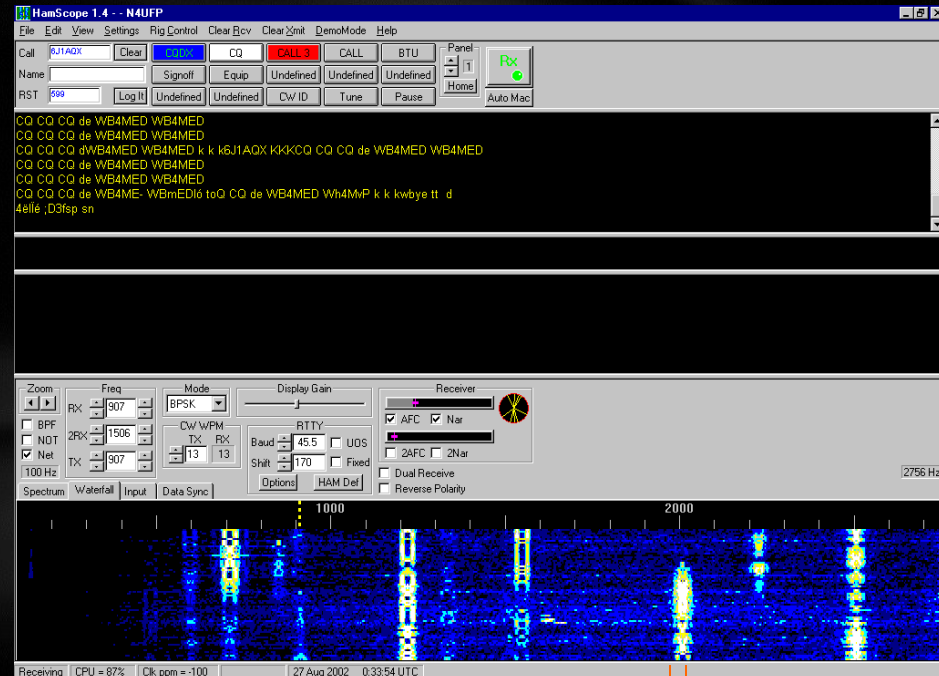

Transcontinental QSO's using PSK-31 are possible using less than 50 W

- 5W QRP PSK-31 contacts are possible to any point on the planet.

# Bandwidth Utilization

Bandwidth ~ 200 Hz

Bandwidth ~ 40 Hz

Waterfall display on the left shows several RTTY signals

Waterfall display on the right shows many PSK-31 signals

For the same character rate (~ 50 wpm) PSK uses 1/5 the bandwidth

A 3 kHz SSB channel can support 10 or more PSK QSO's

# PSK-31 Station Requirements

Amateur transceiver that has low frequency drift

- Any modern solid state rig is OK (IC-706, IC-746, TS-940, TS2000, FT-1000, Omni VI, etc.)

PC (90 MHz Pentium 1 or faster or a Mac)

- Most PSK-31 software is compatible with any version of Windows
- Sound card (16 bit Sound Blaster or better) is required
- **Old junk PC**

An interface that connects the PC and the transceiver

- Homebrew, easy to build your own
- Commercially made (Tigertronics, RigBlaster, RASCAL, etc.)

Computer Software

- Digipan, simple and free
- FLDigi – Linux, Windows, & MAC, supports many digital modes, free
- Ham Radio Deluxe – DM780, fully featured, many modes, more complex

# The PC Soundcard Interface

The interface provides matching and isolation between the audio inputs and outputs of the PC and the transceiver

The interface may also provide connections between the computer's serial port and the PTT input of the transceiver

Commercially made interfaces provide lots of functions and are very easy to install.

A simple homebrew interface can normally be built for less than \$10.

Certain transceivers can be connected directly to a PC:

ICOM 7100, 7200, 7600, & 7700 has built in sound card, USB cable to PC

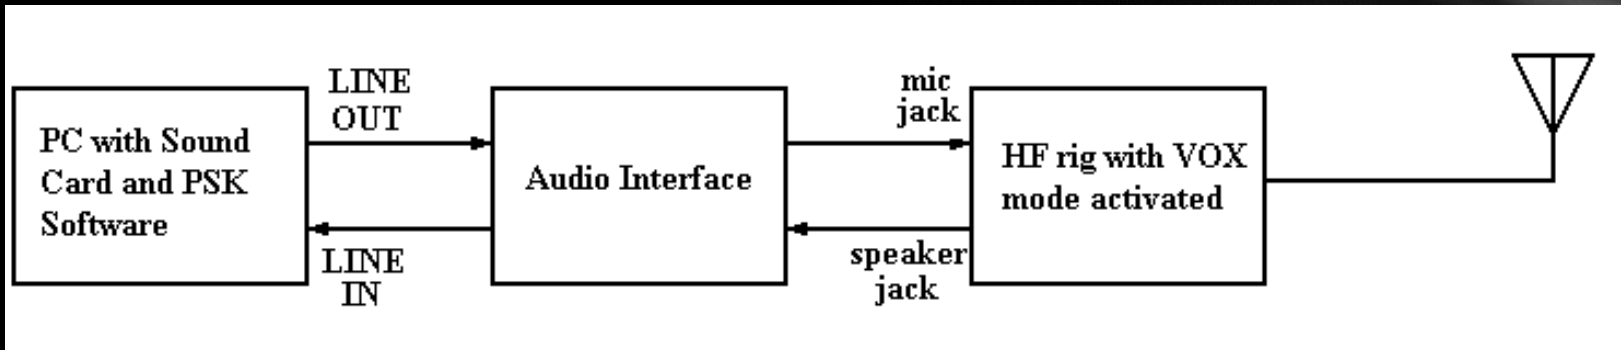

# My Video Demo

The screenshot shows the K7AGE - DigiPan software interface. The window title is "K7AGE - DigiPan". The menu bar includes File, Edit, Clear, Mode, Options, View, Lock, Configure, and Help. Below the menu bar is a control panel with buttons for Lookup, CQ, Sign, Signoff, Etc, Brag, T/R, Search, Clear, and Multi. There are also input fields for Call, Name, Ser#, Band, and No. The main display area is divided into three sections: a top section with "IT C eX" and "e", a middle section with a large digital spectrum display showing a signal at approximately 2000 Hz, and a bottom section with a status bar. The status bar shows TX and RX indicators, a signal strength indicator, and the text "Sig AFC Smap BP5K31 08/11/2007 21:22:07 z".

# How To Receive PSK31

**K7AGE**

# Basic PSK-31 Station Set-Up

The HF rig should be in the USB mode.

The VOX should be activated

Output power should be set to 30 – 50 W

The transmit level should be set using the level controls in the software or the rig's mic gain control so that the ALC level is in the desired range

The receive level should be adjusted to a level that does not overdrive the sound card

# Audio Interface Circuits

## 1. Acoustic Coupling

- **Rig's speaker is placed near the PC's microphone**
  - *As seen in K7AGE's video!*
- **Rig's microphone is placed next to the PC's speaker**
  - *I received emails from hams doing this!*
- **VOX is used for T/R switching**
- **Advantages**
  - Easy to try, no extra equipment required.
- **Disadvantages**
  - Transmit levels can be tricky to adjust
  - Ambient noise degrades signal

# Audio Interface Circuits

## 2. Capacitive Coupling

- Simplest possible circuit
- Two capacitors are used to:
  - Block DC
  - Provide proper audio attenuation (C and input R of rig/PC forms a high pass filter)
- Capacitor value is approximately  $0.1 \mu\text{F}$ . Some experimentation with other values may be required

Radio AUX output  
or speaker jack

Sound Card  
LINE IN

Radio AUX input  
or microphone jack

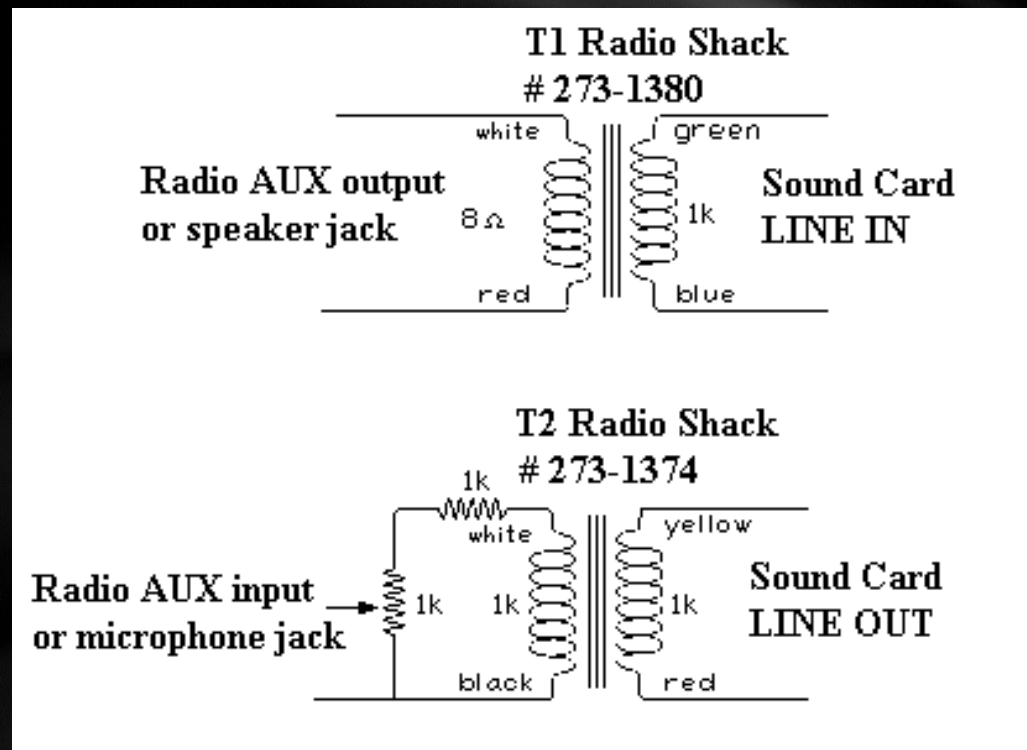

Sound Card  
LINE OUT

# Audio Interface Circuits

## 3. Inductive Coupling

- More complex circuit: 2 audio transformers, a resistor, and a potentiometer are required
- Provides good isolation
- Potentiometer is used to set audio drive level for the transceiver

# PTT/RS-232 Interface Circuit

- **If you are good,**
- **You can build this into a DB9 connector hood.**

**RTS Line**

**pin 4 on DB25**

**pin 7 on DB9**

**Ground**

**pin 7 on DB25**

**pin 5 on DB9**

# VOX Switching

## 2. VOX operation

- **Extremely simple; no connection is required between the RS-232 port and the rig**
- **VOX gain, delay and ANTI-VOX must be adjusted for proper T/R switching**
- **Applies only to transceivers that have VOX circuits**
- **Provides good isolation between rig and computer**
- **Leaves the serial port free for rig control**

# Setting up your Station for PSK<sub>31</sub>

## Set-up of receive audio levels

- This is done through MS Windows' audio mixer or application.
- Adjust the "Line In" that gives the best looking waterfall display in the PSK<sub>31</sub> software

## Set-up of transmit audio levels

- This is also done through MS Windows' audio mixer or application.
- Transmit an idle PSK<sub>31</sub> signal into a dummy load and monitor the RF power.
- Increase level until RF power stops increasing, then back off a little
- Read your radio's manual for correct ALC setting

## Watch out for "You Got Mail" blasting on 20 meters!

- Shut down programs that make noise
- If using second sound card, configure for only radio sounds!

# This is what over driving looks like

This is what over driving looks like

Even QRP can be wide  
5 watts from a KX3 station
